

Dual antiplatelet therapy (DAPT) in 2023 -The McGill Experience

James (Jay) Brophy MD PhD

Professor Departments of Medicine and of Epidemiology, Biostatistics, and Occupational Health McGill University

Conflicts of Interest

• None

Learning Objectives

- 1. Understand the strengths and weaknesses of different research designs
- 2. Understand the current evidence base comparing different DAPT regimes
- 3. Appreciate the new research evidence, generated locally, into the comparative effectiveness of the different DAPT regimes

Acknowledgement

This work largely comes from Stephen Kutcher's PhD thesis

Background

Forest Plot

It's not only about the data

- Statistical inferences require a mathematical model
- A mathematical model aims to explain the data generating mechanism -> better understanding & decision making

Broad variation in the findings from 73 teams testing the same hypothesis with the same data. The distribution of estimated AMEs across all converged models (n = 1,253) includes results that are negative (yellow; in the direction

doi:https://doi.org/10.1073/pnas.2203150119

Statistical Analyses

- <u>Fixed-effects Models:</u> Assume no between-study heterogeneity (i.e., all variability present is within-study variability that is due to chance alone).
 - E.g., Peto, Mantel Haenszel
- <u>Random-effects Models</u>: Assume the presence of both within- and between-study heterogeneity (e.g., due to differences in population, study design, etc.)

- E.g., DerSimonian and Laird

- <u>I² Statistic</u>: Estimates the proportion of the total heterogeneity (or variance) that is due to between-study heterogeneity.
 - Can be used as basis for choice of model.

The (PICO) research question

Is a DAPT regime of ticagrelor / aspirin superior to clopidogrel / aspirin in reducing cardiovascular (CV) events in patients undergoing percutaneous coronary interventions (PCI) following an acute coronary syndrome (ACS)?

- Population ACS pts post PCI
- Intervention ticagrelor / aspirin
- Comparator clopidogrel / aspirin
- Outcome death or CV hospitalizations

Hasn't the question already been answered?

RESULTS

At 12 months, the primary end point — a composite of death from vascular causes, myocardial infarction, or stroke — had occurred in 9.8% of patients receiving ticagrelor as compared with 11.7% of those receiving clopidogrel (hazard ratio, 0.84; 95% confidence interval [CI], 0.77 to 0.92; P<0.001). Predefined hierarchical testing of secondary end points showed significant differences in the rates of other composite end points, as well as myocardial infarction alone (5.8% in the ticagrelor group vs. 6.9% in the clopidogrel group, P=0.005) and death from vascular causes (4.0% vs. 5.1%, P=0.001) but not stroke alone (1.5% vs. 1.3%, P=0.22). The rate of

Yes, for certain people

CCS Guidelines 2012 & 2018

Canadian Journal of Cardiology 29 (2013) 1334-1345

Society Guidelines

Focused 2012 Update of the Canadian Cardiovascular Society Guidelines for the Use of Antiplatelet Therapy

Jean-François Tanguay, MD, CSPQ, FRCPC, FACC, FAHA, FESC,^a Alan D. Bell, MD, CCFP,^b Margaret L. Ackman, BSc(Pharm), PharmD, ACPR, FCSHP,^c Robert D.C. Bauer, MD, FRCPC, FACC,^d Raymond Cartier, MD, FRCPC,^e Wee-Shian Chan, MD, FRCPC,^f James Douketis, MD, FRCPC,^g André Roussin, MD, FRCPC,^h Gregory Schnell, BSP, MD, FRCPC,ⁱ

 We recommend ticagrelor 90 mg twice daily over clopidogrel 75 mg daily for 12 months in addition to ASA 81 mg daily in patients with moderate to high risk NSTEAC (Strong Recommendation, High-Quality Évidence)

But not for everyone

- FDA refused 1st review , accepted 2nd in 2011 dissenting opinions (6-4)
 - "Lack of Robustness of PLATO Superiority with Failure in the US Makes a Confirmatory Study Mandatory."
 - "Besides failure in the US, superiority was only evident in the adjudicated results."

Another question about PLATO

International Journal of Cardiology 168 (2013) 4076–4080

Accounting for this uncertainty

 Standard analysis treats all patients as identical and make inferences on "average patient"

Bayesian

Same data but different statistical analyses -> different conclusions

Hierarchical

Reasons for Conducting a Systematic Review

- Summarize state of literature
 - Qualitatively via systematic review
 - Quantitatively via meta-analysis
- Address a question where multiple studies have been performed
- Explicitly examine heterogeneity of literature
- Clinical practice and public health decision making both require good evidence

DAPT following an ACS: A systematic review and Bayesian network meta-analysis

Major Bleeding

Conclusions of BNMA

- When compared to clopidogrel, prasugrel and ticagrelor were associated with moderate (68%) and very modest probabilities (23%) in clinically meaningful MACE reductions, respectively.
- Prasugrel and ticagrelor had high (84%) and moderate (68%) probabilities of clinically meaningful increases in bleeding.
- Despite guideline recommendations, the net clinical benefit for these drugs compared to clopidogrel appears modest but residual uncertainty remains
- Also uncertain is the generalizability of these results to our local environment

When Can Meta-Analyses Mislead?

- When a meta-analysis is done outside of a systematic review
- When poor quality studies are included or when quality issues are ignored
- When inadequate attention is given to heterogeneity
 - Indiscriminate data aggregation can lead to inaccurate conclusions
- In the presence of reporting biases

Egger M et al. Clin Med²⁴2001.

Reporting Biases

Type of reporting bias	Definition
Publication bias	The <i>publication</i> or <i>non-publication</i> of research findings, depending on the nature and direction of the results
Time lag bias	The <i>rapid</i> or <i>delayed</i> publication of research findings, depending on the nature and direction of the results
Multiple (duplicate) publication bias	The <i>multiple</i> or <i>singular</i> publication of research findings, depending on the nature and direction of the results
Citation bias	The <i>citation</i> or <i>non-citation</i> of research findings, depending on the nature and direction of the results
Language bias	The publication of research findings <i>in a particular language</i> , depending on the nature and direction of the results
Outcome reporting bias	The <i>selective reporting</i> of some outcomes but not others, depending on the nature and direction of the results

Real-world comparative effectiveness of clopidogrel and ticagrelor for acute coronary syndromes in Quebec

Balancing the groups via PS

Results

	Ticagrelor N=6,959	Clopidogrel N=15,777	HR (95% CI) unadjusted	ATE weighted + adjusted**
MACE	490 (7.0%)	1733 (11.0%)	0.66 (0.59, 0.73)	0.91 (0.81, 1.01)
All-cause mortality	137 (2.0%)	628 (4.0%)	0.51 (0.43, 0.62)	0.80 (0.66, 0.97)
МІ	317 (4.6%)	937 (5.9%)	0.78 (0.69, 0.89)	0.99 (0.86, 1.13)
Stroke	36 (0.5%)	168 (1.1%)	0.50 (0.35, 0.72)	0.79 (0.53, 1.17)
Bleeding	84 (1.2%)	235 (1.5%)	0.97 (0.75, 1.24)	0.97 (0.75, 1.24)

Conclusion

After ATE weighting using propensity scores in ACS patients who underwent a PCI, ticagrelor was not significantly associated with a decrease in ischemic events nor bleeding outcomes.

<u>Caveats</u>: Causal inferences are limited by observational data with potential missing and residual confounding, missing data, and possible time trends

Ticagrelor Compared to Clopidogrel in aCute Coronary syndromes – TC4 a pragmatic cluster randomized controlled trial

Methods

- From Oct 2018 to Mar 2021, ACS patients with PCI
- Randomized into pragmatic, open-label, time clustered, trial
- 1^o endpoint composite of all-cause mortality, non-fatal MI, or ischemic stroke (MACE).
- 1° safety endpoint was hemorrhagic stroke or GI bleeding requiring hospitalization.
- Outcomes were ascertained with 12 months FU using administrative databases
- Bayesian Cox proportional hazard models were used to evaluate all outcomes, using vague, "skeptical", "enthusiastic", and "summary" informative priors.

Essay

Doing New Research? Don't Forget the Old

Nobody should do a trial without reviewing what is known

Mike Clarke

n May 2, 1898, George Gould used his address to the founding meeting of the Association of Medical Librarians in Philadelphia to present a vision of the future of health information. 'I look forward,' he said, 'to such an organisation of the literary records of medicine that a puzzled worker in any part of the civilised world shall in an hour be able to gain a knowledge pertaining to a subject of the experience of every other man in the world' [1]. Has his vision been realised?

good quality, but some of it is not. Thus, anyone wishing to use the health literature to make well-informed decisions must both identify the relevant research from amidst this vast amount of information and then appraise it. This is an impossible task for many. Even though making access to the literature easier and cheaper will increase the ability of people to find research, it will also reveal just how much information there is out there and how daunting is the task of making sense of it.

with one or more search engines? Almost certainly, as the speed of the search increased through these four

Box 1. Practical Suggestions for Researchers

 Conduct a systematic review of your research question before embarking on a new study, or identify a relevant review done by someone else.

- Design your study to take account of the relevant successes and failures of the prior studies, and of the evidence within them.
- Discuss the findings of your study in the context of an updated systematic review of relevant research.
- Publish the systematic review within, alongside, or shortly after the report of your study.
- Provide information from your study to others doing systematic reviews of similar 34 topics.

TC4 - Conclusions

- 1st RCT comparing ticagrelor to clopidogrel with NA pts since PLATO (2009), NA evidence base > 50%
- With vague prior MACE HR, 0.97; 95% Crl: 0.67, 1.40
- Or 35% probability of a clinically meaningful MACE benefit, 40% clinical equivalency and 25% clinically worse
- With NA PLATO prior MACE 2% probability of a clinically meaningful benefit, 38% clinical equivalency, and 60% clinically worse
- With NMA prior (all comers, all evidence) MACE 24% probability clinical superiority, 72% equivalency, 4% clinically worse
- WeaK evidence (≈20% probability) for clinical important (HR>1.1) risk of excessive bleeding with ticagrelor

All roads lead to Rome

All evidence suggests a low probability that ticagrelor (@\$1200/y) is clinically superior to clopidogrel (@\$168/y)

- Plato hierarchical reanalysis
- Bayesian network meta-analysis
- Quebec pharmacoepidemiology study
- TC4 RCT

Additional annual Quebec health care cost \$25MM for a ticagrelor first policy

Ultimately, the choice is yours

McGill Hospital Network Consultancy Program

Thursday, January 11^{th, 2018} Montreal, QC

On behalf of AstraZeneca Canada, we invite you to join us for a consultancy meeting – taking place in Montreal on Thursday, January 11th, 2018. This forum is for the McGill Hospital Network.

The objective of this meeting will be to identify gaps and better understand unique barriers that influence current utilization of DAPT in ACS patient management. With your help, we hope to provide AZ with recommendations on how to overcome these barriers to achieve and support CCS guideline recommended patient management.

You will be provided with an honorarium of \$750.00 plus expenses.

If you are interested in joining us, please let us know by responding to this email. You will receive a confirmation note, with all the pertinent logistical and program details.

Please plan your evening from 5:30-9:00pm.

We hope you are able to join us.

With best regards, Program co-chairs,

Stéphane Rinfret, MD, SM, FSCAI Associate Professor of Medicine, McGill University Chief, Interventional Cardiology, McGill University Health Centre (MUHC) Royal Victoria Hospital Montreal, Quebec

Chair CCS guidelines

Shamir R. Mehta MD, FRCPC, FACC, FESC Professor of Medicine, McMaster University Director, Interventional Cardiology, Hamilton Health Sciences Senior Scientist, Population Health Research Institute Co-chair, 2017 CCS APT Guideline Committee Hamilton, Ontario

INVITATION TO ATTEND / HOLD THE DATE

Thursday, January 11^{th, 2018} Montreal, QC

Letter of apology and clarification – re. email invitation for AZ Consultancy Meeting on Thursday, January 11th in Montreal. Please note this is an AstraZeneca forum (not a McGill program), and my apologizes for using the McGill logo and any confusion this may have caused. It was meant with good intentions – a note of collaboration to bring together representatives from the cardiology community within the McGill Hospital Network.

The goal of this meeting is to discuss and obtain feedback, reaction and insights from advisors on current OAP therapy approaches to ACS patient management, and align with current (and newly presented) CCS APT Guideline recommendations. For your role as advisor, you will be provided with an honorarium of \$750. We are fortunate to have Dr. Stéphane Rinfret, McGill joined by Dr. Shamir Mehta, Hamilton/also co-chair of the 2017 CCS APT guideline committee as co-chairs of this consultancy meeting to support these discussions.

Again, I am sincerely sorry for this oversight. I hope you will attend.
